3.1 (c) (1) REPEAT

HOUSING FACILITIES, GENERAL.

(1) General requirements. The surfaces of housing facilities--including houses, dens, and other furniture-type fixtures and objects within the facility--must be constructed in a manner and made of materials that allow them to be readily cleaned and sanitized...

Kennel Room:

4 Large indoor kennels have angled metal in the back of the runs and a pipe drainage system that makes cleaning and sanitization difficult. These kennels also have galvanized metal support structure that is beginning to rust and become "pock marked". Viruses, bacteria, and odors can buildup in the closed drainage system without the ability to properly clean and disinfect. The "metal fatigue" that is evident on the galvanized metal also creates areas that cannot be appropriately sanitized. Facility has added 4 new indoor kennels, but 4 old kennels still remain which require modification or replacement. This is a repeat noncompliance.

3.2 (b) REPEAT

INDOOR HOUSING FACILITIES.

(b) Ventilation. Indoor housing facilities for dogs and cats must be sufficiently ventilated at all times when dogs or cats are present to provide for their health and well-being, and to minimize odors, drafts, ammonia levels, and moisture condensation...

The metal air vents in the ceiling of the kennel room continue to have a buildup of dust, dirt, and hair. The unseen air ductwork is also of concern due to the unacceptable buildup on the ceiling vents. Dust and bacterial contamination of the air in these rooms could be occurring, potentially causing adverse health effects to the animals. There were 9 dogs in the kennel room at the time this problem was noted.

The ventilation system should be properly assessed and corrections should be implemented. This is a repeat noncompliance.

Inspection Report

3.2 (d) **REPEAT**
INDOOR HOUSING FACILITIES.

(d) Interior surfaces. The floors and walls of indoor housing facilities, and any other surfaces in contact with the animals, must be impervious to moisture....

The walls in the following rooms are constructed of painted drywall. Kennel area with 9 dogs, Room 115N with 13 cats, Room 117N with 2 ferrets, 5 Guinea Pigs, 5 Gerbils, as well as various rats and mice. There are various gouges, scratches and peeling paint on walls in these rooms.

Room 115N:
Drywall near light switch has areas that are scratched/gouged.

Room 117N:
Very large area of scratched/chewed drywall on the south wall

Kennel Area:
Scratches and gouges in the drywall on the south and east walls.

Exposed drywall is not impervious to moisture and therefore cannot be properly cleaned and sanitized. Nonimpervious surfaces create potential areas that harbor bacteria, viruses, and odors. Kennel walls should be covered with a product that protects them from the physical damage that is currently occurring during day to day use and animal housing. This is a repeat noncompliance.
