Type: ROUTINE INSPECTION

PULLMAN, WA 99164

Date: Aug-06-2009

3.131 (d)

SANITATION.

"Sec. 3.131 Sanitation

(d) Pest control. A safe and effective program for the control of insects, ectoparasites, and avian and mammalian pests shall be established and maintained."

The hospital area housing 5 teaching herd horses has a large number of flies on and around the animals. Adequate fly control is necessary to minimize disease transmission and for the comfort of the animals.

The program specialist stated that corrections can be made within 24 hours, by close of business 8/7/2009.

The inspection was accompanied by the Assistant Director of the Office of the Campus Veterinarian and the Program Specialist for post-approval monitoring.

3.125 (a)

FACILITIES, GENERAL.

"(a) Structural strength. The facility must be constructed of such material and of such strength as appropriate for the animals involved. The indoor and outdoor housing facilities shall be structurally sound and shall be maintained in good repair to protect the animals from injury and to contain the animals."

The quarantine stall containing a horse appears to be designed for cattle. The metal pipe panels and head-catch restraint system has hinged projections into the primary enclosure. The horse has a hairless scraped area on its forehead, and the horse was observed to bump his head on a projection at the time of inspection. The projections pose a risk of injury to the horse.

The AV indicates that a temporary fix can be made by applying "bumpers" to the projections -- some kind of padding to protect the horse from bumps. This correction can be made within 30 days -- by 9/16/2007. A permanent fix -- either modifying the enclosure or no longer housing horses in this particular enclosure -- can be made within 4 months -- by 12/16/2007.

3.131 (d)

SANITATION.

"(d) Pest control. A safe and effective program for the control of insects, ectoparasites, and avian and mammalian pests shall be established and maintained."

The grizzly building has a fair number of flies throughout the building. There is no evidence of fly control measures in place. Also, there are two uncovered 5 gallon buckets of kibble-type food on the floor of the food prep area, and a third 5-gallon bucket that has not been cleaned since last used. No one was working in the bear facility at the time of inspection.

The uncovered food and unwashed feed buckets can attract pests. Keeping the food prep area clean, with food covered, and implementing fly control measures such as pest strips will minimize the disease-carrying pest problem.
